

Day 5 - 08 June 2026

• Introduction to SQL

- Practice everyday - min 30 min

- Be consistent from the beginning!

• Structured data

→ Data stored in a table
↳ inside a database

↳ When we have data - we need to extract insights from the data [juice from the data]

↳ Standard Query Language (SQL)

- is a scripting/coding language that we use to interact with structured data. We need to have a structured table to use SQL

- We use SQL to retrieve information from a structured table

e.g

Students_results

Student id	name	marks
101	Mbali	99
102	Thando	25
103	Naledi	50
104	Botle	60

SELECT STATEMENT

↳ allows us to select the specific columns

from our table

FROM STATEMENT

SELECT name, marks;

FROM students_results

↳ allows to specify the name of the

table we are selecting the data from

↓

Name	Marks
Mbali	99
Thando	25
Naledi	50
Botle	60

The SELECT statement allows you to specify the

columns you want in your final output

• SELECT * is a way to select all the columns from your table without specifying the column names individually

• When you say SELECT * you want all the column names in the table. Gets you all the column names

e.g SELECT *

FROM retail_sales_dataset;

• When you don't want all the column names:

e.g
SELECT Date, Gender, Age
FROM retail_sales_dataset;

no comma before the FROM statement

When you are selecting specific column names, you separate each column name by a comma (,)

means different
unique

• SELECT DISTINCT statement

↳ You want to get different values from a specific column

↳ We remove duplicates / we do not repeat the same value

Syntax! **SELECT DISTINCT** column_name
FROM table_name

e.g

FRUITS_ORDERS

Order_id	Product_name	Revenue
101	Apple	100
102	Orange	50
103	Apple	60
104	Banana	150

↓

SELECT DISTINCT product_name

Specify the column name
you want different values
from

FROM fruit_orders

↓

Product_name
Apple
Orange
Banana
